pentameric structures. However, pentaxins resemble more closely legume lectins such as concanavaline A and pea lectin. Alignment of sequences on the basis of topologically equivalent features of three dimensional structures shows that helices occupy different positions in the pentraxins and legume lectins and that the amino acid sequences of the two families have identities of only approx. Il% The two main helices in SAP occur before and after strand L, whereas the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAR74763-70 represent various pentraxins and legume lectins. All these proteins show structural homology and may be used in the molecular design of a molecule for the inhibition of serum amyloid P (SAP) binding to amyloid fibrils. The similarities in the amino acid sequences of SAP, human and Limulus C-reactive protein (CRP) and femmele hamster protein suggests that they may have similar 3-D structures. The jellyroll topology of the pentraxins is reminiscent of the picornavirus coat proteins which also have
  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage asused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially uşeful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous cells including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The
helices in the legume lectins occur at the C-terminus of strand J. There is a long insertion between the end of the helix after strand D and the begining of strand E in the lectins relative to pentraxins. Strands G, H and I together with the type IV beta-hairpin between H and I are identical in both SAP and pea lectin. The so-called pentraxin octapeptide signature sequence, HXXXS/TWXS, is in this region so it is not conserved in the legume lectins.
                                                                                                                                                                                                                                                                                                         PGDGLAFFLAPYDTVIPPNSAGNLLGLFPNLNALRNSTTSKETTIDVNAASNNVVAVEFD 143

The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a polypeptide subunit of R. pseudoacacia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially particularly human cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not including mucous membrane). We so the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a R. pseudoacacia lectin Rebal. This lectin is composed of two subunits- polypeptide a and polypeptide bill ectin and and polypeptide by

in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous cells including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents as R. pseudoacacia lectin RPDAII. This lectin is composed of the subunit polypeptide c (AAY06813).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to Robinia pseudoacacia lectins which can be used

Lincoln lectin. The invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A (see AAY58737) and pea lectin; transgenic plant cells containing at least 1 copy of the DNA; a new lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen beetles) of the genus Meligethes, flea beetles of the genus phyllotreta, and root flies of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2 QSVSFTFTKFDSDQKDLMFQGHTISSSNVIQLTKLDSNGNPVSTSVGRVLYSAPLRLWES 61

The protein derivs, are effective larvicides against insect pupae, such as the European corn borer. The protein can be administered enterally to the larvae in their diet and can be see also AAR45912.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 STVVSTFETTFT---QISTPYTSPPGDGLAFFLAPYDTVIPPNSAGNLLGLFPNLNALR 118

The invention describes compounds derived from Bauhinia purpurea lectin (BPL), a 262 amino acid peptide comprising 7 lysine residues - the present sequence) by the replacement of one or more lysine residues with other amino acid residues which either preserve the positive charge or provide a neutral residue at the point of substitution. The compounds are useful as larvicides against insects such as the European corn borer (Ostrinia nubilalis). The compounds may be used to protect commercial and field crops from insect larvae infestation, especially by the European corn borer. The BPL-derivatives are effective against insects which may be resistant to the naturally occurring form of BPL. Crops which may be protected using the BPL derivatives are corn/maize (Zea mays), rye, be protected using the BPL derivatives are corn/maice (Zea mays), rye, anilet, rice, triticale, sunflower, alfalfa, rapessed and soybean), fiber crops (such as onion, pepper, tomato, cucumber, squash, carrot, crucifer (e.g. cabbage, broccoli and cauliflower), eggplant, spinach, potato and lettuce). The compounds are useful for protecting species from the genera critical Linum Geranium Anaiont Dancer arabidons and vigna, resident and cauliflowery are defined to an anaion of the protecting species from the genera critical Linum Geranium Anaiont Dancer and a particular and cauliflowery and anaions and anaions and continue fragarial and cauliflowery and anaions and anaions and continue fragarial and cauliflowery and anaions and a

Sequence 77, Application US/09228986
Patent No. 6353198
GENERAL INFORMATION:
APPLICANT: Strabala, Timothy
APPLICANT: Nieuwenhuizen, Niels
TILLE OF INVENTION: Compositions Isolated from Plant Cells
TILLE OF INVENTION: Compositions in the Modification of Plant Cell Signalling
FILE REFERENCE: 11000/1020
CURRENT APPLICANTION NUMBER: US/09/228,986
CURRENT PILLIG DATE: 1999-01-12
NUMBER OF SEQ ID NOS: 130
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                          4

The present sequence represents a FRIL (FIR2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or patient prior to treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity alleviates or therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive below.
                                                                                                                                                                                                                                                                                                                                                                                                                a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lectin derived progenitor cell preservation factor; progenitor cell; haematopoietic cell; cultured cell preservation; anticancer therapy; myeloablative therapy; sickle-cell anaemia; ablative therapy protection;

```
The present sequence represents a lectin derived progenitor cell
preservation factor. The protein is used to preserve unipotent,
cells, protent or totipotent progenitor cells, especially haematopoietic
cells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and also progenitors from nerve, muscle, skin, gut, bone,
kidney, liver, pancreas or thymus. Specific applications are
cells of cultured cells intended for administration after
continued cells (e.g. during a vivo purging of malignant cells);
continued to reconstitute the haematopoietic system; enrichment
continued to result of the control of malignant cells);
creatment of tissues containing haematopoietic progenitors for subsequent
creatment of tissues of the cells (in gene therapy of various
cagainst ablative therapy (to eliminate proliferating cells specifically),
followed by re-establishment of differentiation and proliferation of
preserved progenitors. The protein, when linked to magnetic beads, may
also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 NSMAVSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLY--SNVFRNS 118

The Pissent sequence traptresents a rate transfer teceptor interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chematopoietic progenitor cell-depleting activity of a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient. FRIL family members are useful for reduces the hematopoietic progenitor cell-depleting activity of the charapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive is also administered to patients having, or predisposed to developing a condition where the patients having, or predisposed to developing a condition where the patients having, or predisposed to developing the isolated mesenchymal cells are useful for tissue repair. 4, NSMAVSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLY--SNVFRNS 118 119 PTSENQSFGDVNTDSRVVAVEFDTFPNANI-DPNYRHIGIDVNSIKSKETARWEWQNGKT 177 6; Gaps 1 AQSLSFNFTKFDLDQKDLIFQGDATSTNNVLQLTKLDSGGNPVGASVGRVLFSAPFHLWE 60 50.3%; Score 804; DB 22; Length 264; 60.9%; Pred. Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer Example 1; Page 59; 173pp; English. therapeutics

The present sequence represents fusion protein of alpha-amylase inhibitor signal peptide and FRIL (FIR2/FI13 tyrosine kinase receptor-interacting lectin). The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor. Cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics having, or predisposed to developing a dministered to patients having, or predisposed to developing a condition where the patients having, or predisposed to developing a depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoletic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoletic progenitor cell-depleting activity alleviates or

therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients hematopoietic progenitor cells are condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                          121 TTSKETTI-DVNAASNNVVAVEFDTYPNDNIGDPRYKHIGIDVNSIRSKATVAWDWQNGK 179

The present sequence is that of the concanavalin A (Con A) lectin of jack bean. The present invention relates to: a transformed brassica plant that is resistant to certain insect pests, an expression cassette containing DNA that codes for at least lectin selected from Con A, modified Con A (see AAY58737) and pea lectin (see AAY58738); transgenic plant cells containing at least copy of the DNA; a new lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen beetles) of the genus Meligethes, fleabetles of the genus PAP1lotreta, and root files of the genus PAP1 and a method for protecting a plant against infestation by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Concanavlin A; Con A; lectin; jack bean; insecticide; transgenic plant; Brassica; insect resistance; mutant; mutein.

The present sequence is that of a jack bean concanavalin A (Con A) mutein in which the Asn-152 residue of the native protein is replaced by Ser in order to disrupt a glycosylation signal. The present invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A plant calls containing at least 1 lectin selected from Con A (see AAY58736), modified con A and pea lectin (see AAY58738); transgenic plant cells containing at least 1 copy of the DNA; the present lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen beetles) of the genus Meligethes, (lea beetles of the genus Phyllotreta, and root flies of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  62 SMAVSSFETNLTIQISTP--HPYYAADGFAFFLAPHDTVIPPNSWGKFLGLY--SNVFRN 117

The sequences given in AAR74763-70 represent various pentraxins and legume lectins. All these proteins show structural homology and may be used in the molecular design of a molecule for the inhibition of serum amyloid P (SAP) binding to amyloid fibrils. The similarities in the amino acid sequences of SAP, human and Limulus C-reactive protein (CRP) and female hamster protein suggests that they may have similar 3-D structures. The jellyroll topology of the pentraxins is reminiscent of the picornavirus coat proteins which also have pentameric structures. However, pentaxins resemble more closely legume lectins such as concanavaline A and pea lectin. Alignment of sequences on the basis of topologically equivalent features of the positions in the pentraxins and legume lectins and that the amino acid sequences of the two families have identities of only approx. 11%. The two main helices in SAP occur before and after strand L, whereas the helices in the legume lectins occur at the C-terminus of strand J.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     There is a long insertion between the end of the helix after strand D and the begining of strand E in the lectins relative to pentraxins. Strands G, H and I together with the type IV beta-hairpin between H and I are identical in both SAP and pea lectin. The so-called pentraxin octapeptide signature sequence, HXXS/TWXS, is in this region so it is not conserved in the legume lectins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | | | ::|||| ||
